The **Fondor** premises stand on the outskirts of Bergamo, covering an area of 13,000 sq.m.

Its main plants include:

- Shell Moulding Department with cyclic sand reclamation
- Induction furnace with capacity of 40 tonn.
- Sandblasting and finishing department
- Machine shop department for mechanical work (permitting the milling of surfaces up to 5,000 x 3,100 mm)

The **Fondor** foundry uses selected hematite pig iron to cast up to 35 ton ingot moulds of any type and shape as well as plates, bottoms, pot and other casting pit equipment.

On specific request of the client, at the **Fondor** is possible to create spheroidal cast iron's casting with a unitary weight up to 10 tonn.

Fondor ingot moulds are destined for the Italian, European and international markets.

Our commercial policy aims to do more than market a top-quality product, through :

- Careful choice of raw material
- Continuous analysis
- Rigorous classification and sampling procedures

Moreover it provides to steelworks different services such as:

- Ingot mould designing drawn up according to ingot dimensions and exact needs of the steel plant user
- Periodic visits to the client by specialized foundry technicians versed in the specific problems of the steel plant

It also ensures maximum **Fondor** product quality and fully guarantees our sles terms.

Fondor is equipped with sophisticated manufacturing and control systems designed to produce exceptionally long-lasting ingot moulds.

All foundry activity, from moulding to casting and finishing, is strictly controlled through the use of modern equipment and the observance of quality control procedures that ensure the finest of products.
